

Postman Collections

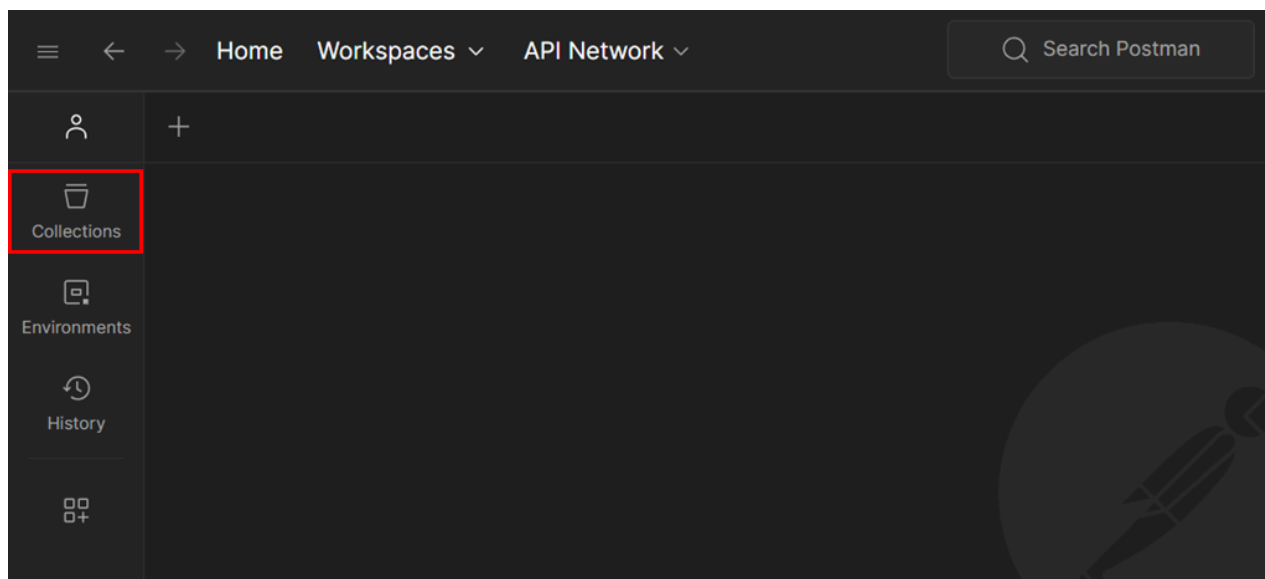

Step 1: Open Postman

- Launch the Postman application on your computer. You can download it from [here](#) if you don't have it yet.

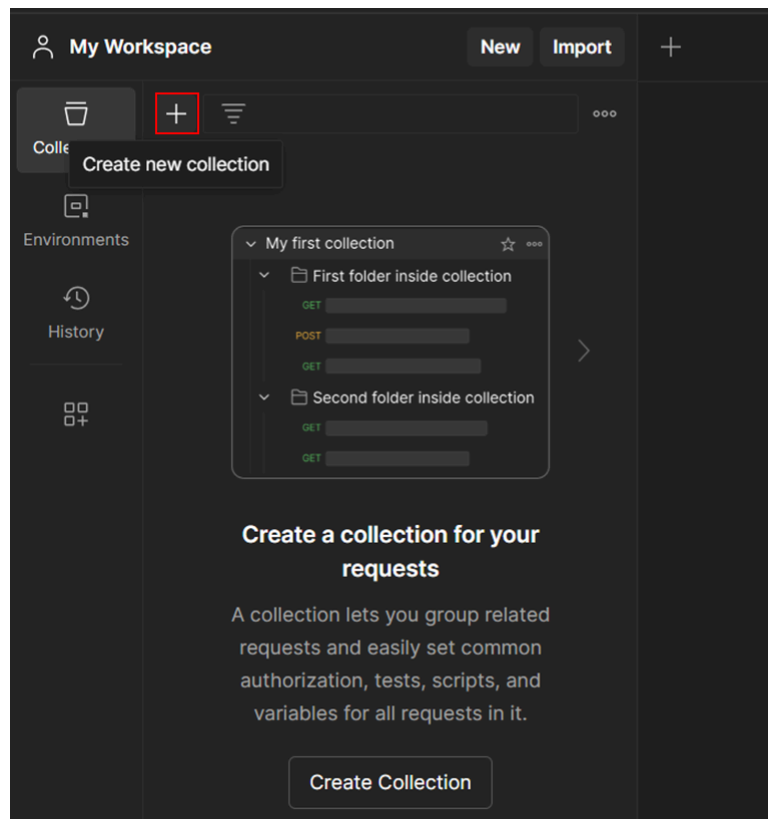

Step 2: Create a New Collection

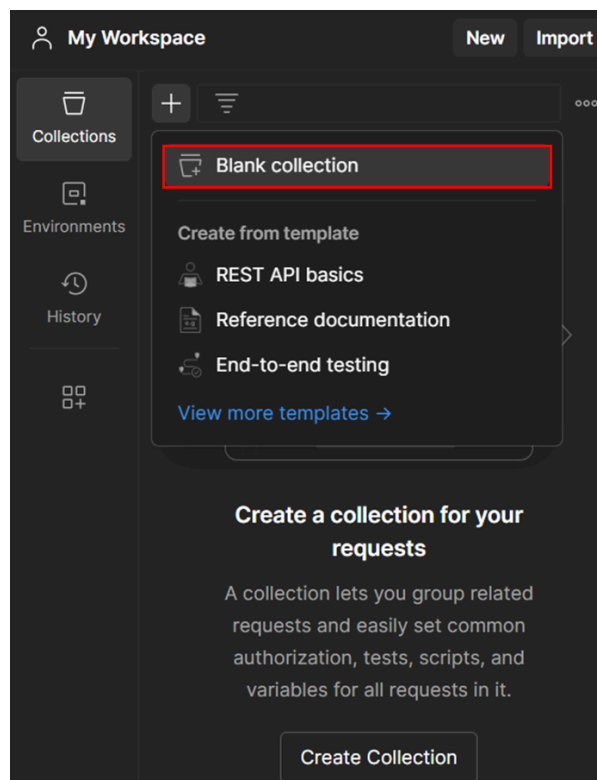

- On the left sidebar, you will see a section titled "Collections."

- Click on the “*Create New Collection*” button (it’s a button with a plus sign, usually at the top-left corner).

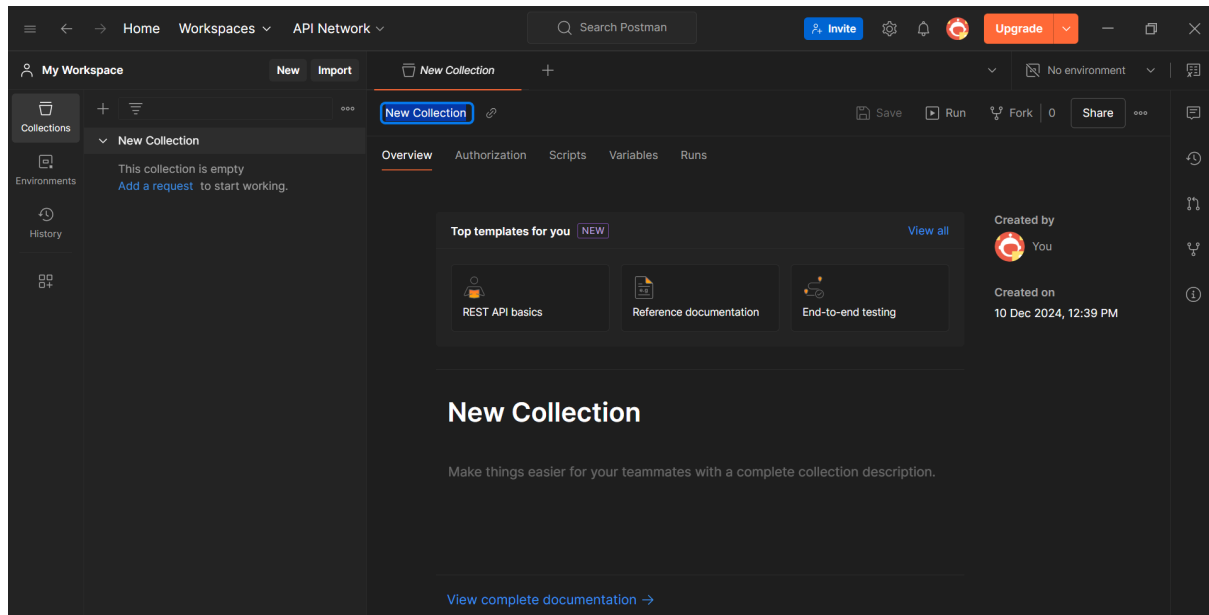

- Select the “*Blank Collection*” from the options that appear.

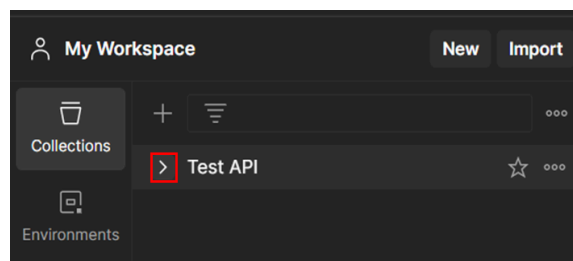

Step 3: Name Your Collection

- A window will pop up asking you to name your collection. Choose a descriptive name, such as *"Test API"*

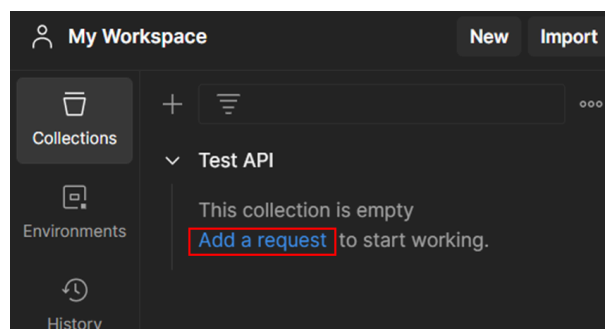

Step 4: Add Requests to Your Collection

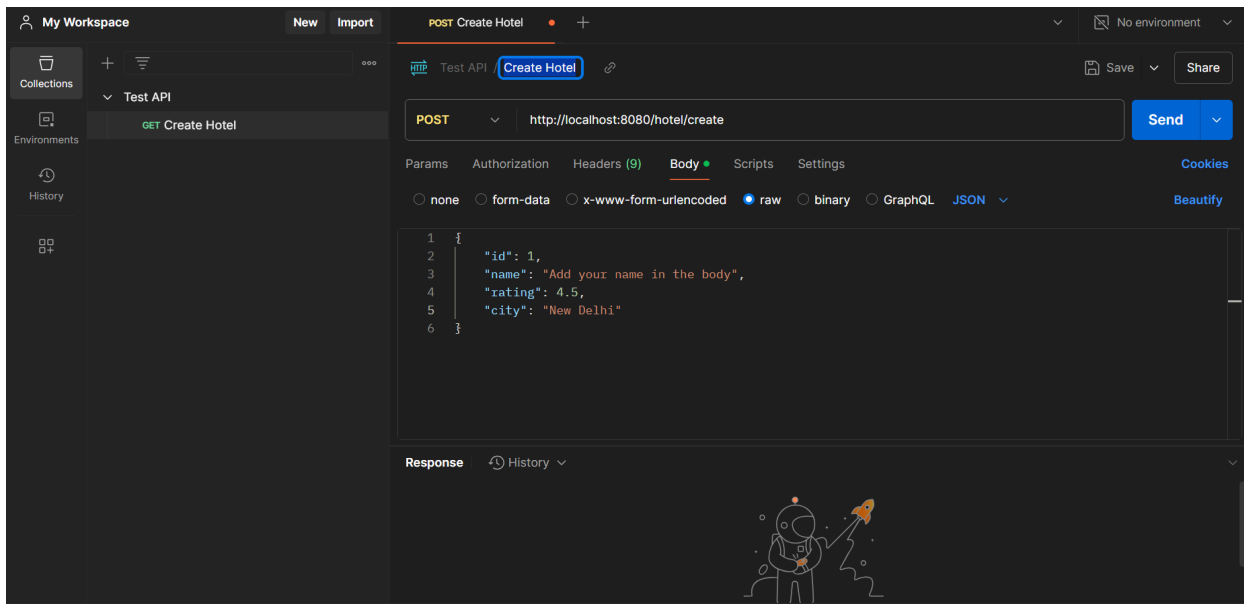

- Once your collection is created, you can start adding requests. Click on your newly created collection on the left sidebar to open it.

- Then click on the *"Add a request"* button either by selecting it from the menu (three dots) when you hover over your collection name or by directly clicking on the hyperlink in the description message as shown below:

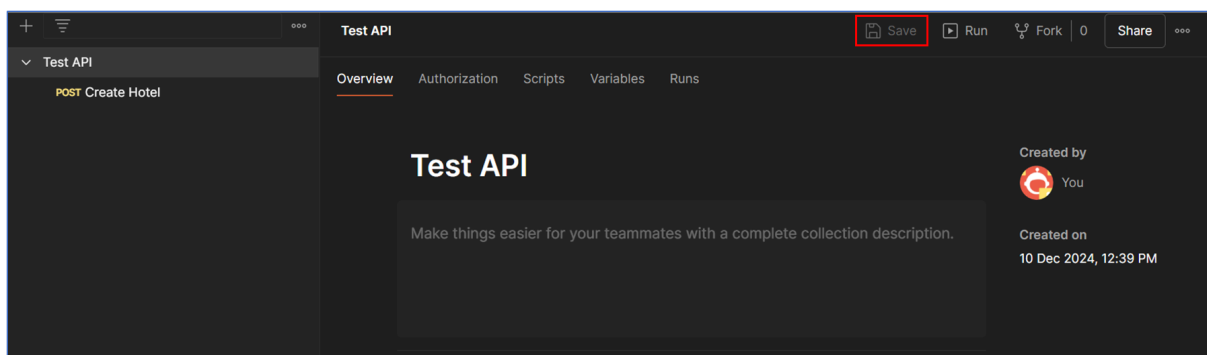

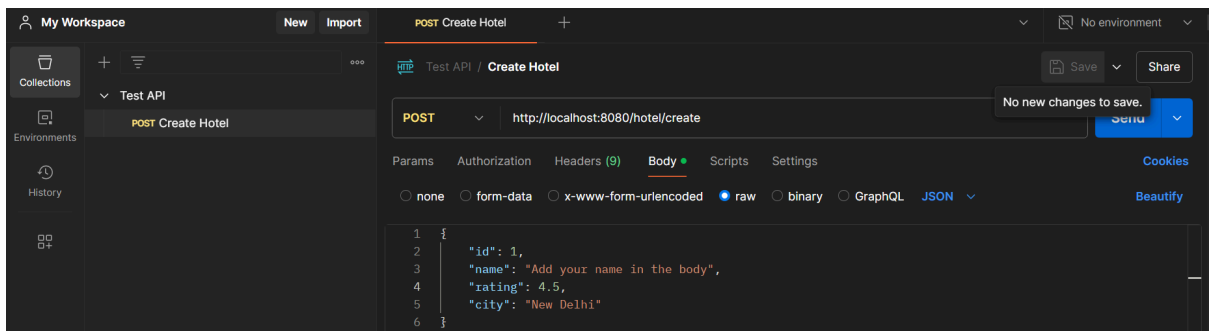

- In the "*Request*" tab, you will define the API's name, select the HTTP method (GET, POST, PUT, DELETE), and enter the URL.

Step 5: Save Your Collection

- Once you've added all your requests, make sure to click the "Save" button on each request, and also click Save Changes for the collection itself.

- By following these steps, you'll have successfully created a well-organized and functional API collection in Postman.
